# Report Snapshot

Agentic media buying and selling promises faster, goal-based automation for ad buyers. But a split between two emerging standards has created short-term uncertainty over which approach marketers should run with. Either way, widespread adoption of the tech remains years off.

**Key Question:** How will competing standards for agentic ad buying and selling reshape the digital advertising ecosystem?

**Key Stat:** Approximately two-thirds of US ad buyers plan to pay closer attention to agentic ad buying this year, per a January survey from the Interactive Advertising Bureau (IAB).

# Agentic Media Buying

- **Agentic media buying uses AI buyer and seller agents to automate the planning, negotiation, and execution of ad transactions.** It promises goal-driven outcomes at lower costs. While interest among ad buyers is rising, actual agent-to-agent media negotiations remain experimental and small-scale. Current capabilities are still lacking, with limited cross-platform automation.
- **The technology could significantly reshape the digital ad ecosystem.** In theory, it will enable more nuanced, real-time decision-making and reduce reliance on intermediaries. Agents can interpret natural language goals, learn from past performance, and optimize campaigns dynamically at scale. This may streamline supply paths and unlock new ad formats, among other benefits.
- **Two competing standards are emerging: AAMP (evolutionary) and AdCP (revolutionary).** AAMP enhances existing programmatic infrastructure to support agents, while AdCP proposes a new, agent-native framework enabling direct, conversational transactions between buyers and sellers. Although the two protocols differ in approach, they may ultimately coexist and complement each other.
- **Adoption faces structural and technical hurdles.** They include the need for new infrastructure, standardized protocols, privacy safeguards, and reliable agent behavior. Early tests show strong performance gains, but most activity remains in controlled environments. Broad adoption is expected to take a couple of years, at best.
- **In the near term, brands and publishers should focus on experimentation and capability-building.** Brands should test within risk tolerance and partner with emerging solution providers, while publishers should prepare API-driven sales models and explore both protocols. Companies that adapt early can shape standards and capture long-term efficiency and revenue opportunities.

## Use Cases for This Report

Definitions

**AI agents** are programs that use large language models (LLMs) to achieve goals, often self-correcting along the way without human input.

**Buyer agents** are AI agents that represent advertisers, their goals, and their budgets.

**Seller agents** are AI agents that represent publishers, their inventory, and their compensation expectations.

**Agentic media buying** uses buyer and seller AI agents to communicate with each other to plan, negotiate, buy, and execute media sales. Humans remain in the loop to approve campaigns, but most of the work before, during, and after the campaign is handled by agents.

Why is there buzz around agentic ad buying and selling?

In recent months, two competing standards for agentic ad buying and selling have emerged—the **Ad Context Protocol (AdCP)**, established by a coalition of ad tech companies, and the IAB-backed **Agentic Advertising Management Protocols (AAMP)**. These protocols—and agentic ad buying itself—are currently in their infancy.

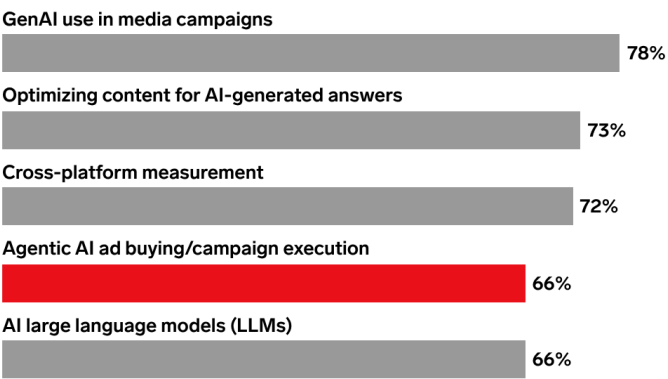

But when fully matured, agentic ad buying stands to dramatically change how ads are bought and sold. Ad buyers will get more flexible campaign strategies with better outcomes and lower costs. Ad sellers will get higher net revenues and more verified demand. But some ad tech vendors and agencies could get disintermediated by the new technology. They'll have to evolve, or else risk becoming obsolete.

Marketers' interest in agentic media buying is growing

In January 2026, the IAB asked marketers about agentic media buying and found strong interest.

- Approximately two-thirds (66%) expected to increase their focus on agentic ad buying this year.

About Two-Thirds of Ad Buyers Plan to Focus More on Agentic Ad Buying in 2026  
% of US ad buyers, on areas where they expect to focus more time or resources this year, Jan 2026

Note: n=205; vs. previous year; top 5 responses shown  
Source: Interactive Advertising Bureau (IAB), "2026 Outlook Study," Jan 28, 2026  
362817 EMMARKETER

- 40% reported that understanding agentic media buying and campaign execution is a top media investment challenge, essentially on par with macroeconomic headwinds (41%).
- 57% used or planned to use agents for programmatic deal execution and negotiations, and 45% used or planned to use them for direct insertion order deal execution or negotiations. This was less than other agentic use cases, but still sizable.

Agentic media buying could transform the digital ad ecosystem

**Agents add nuance, memory, flexibility, and speed to the ad buying and selling process.** Because agents can understand natural language, they can deliver or interpret much more nuanced campaign goals expressed by a media planner through a chatbot. They remember things, so they can negotiate asynchronously and learn from past negotiations and campaigns. They're goal oriented, so they can adjust as situations change or they receive new attribution data. And most importantly, they can make decisions in milliseconds, which gives them a scale and speed that humans can't match.

## Agentic Ad Buying Could Merge the Best of Today's Programmatic and Direct Order Buying Capabilities

| Features        | Current state                                      |                       | Future state                |
|-----------------|----------------------------------------------------|-----------------------|-----------------------------|
|                 | Programmatic                                       | Direct order          | Agentic                     |
| Decision-making | Algorithm (demand-side platform) with human inputs | Human                 | Agent with human oversight  |
| Logic           | Algorithmic (machine learning and rules)           | Goal-driven           | Goal-driven                 |
| Media           | Standard formats                                   | Any                   | Any                         |
| Memory          | Limited (campaign level)                           | Human plus tools      | Persistent, cross-context   |
| Negotiation     | Static auction                                     | Dynamic, asynchronous | Dynamic, often asynchronous |
| Optimization    | Reactive, human-monitored                          | Proactive             | Proactive and instant       |
| Scope           | Channel-siloed                                     | Cross-channel         | Cross-channel               |
| Speed           | Instantaneous                                      | Hours to days         | Instantaneous               |

**Agentic-led transactions could extend beyond programmatic's current boundaries.** Real-time bidding (RTB) was a massive innovation that enabled programmatic advertising at scale, but it lost some of the nuance of direct conversations between ad buyers and sellers. Some proponents of agentic ad buying could bring that nuance back through direct agentic conversations, but at limitless scale. This could remove layers in the supply path and open up nonstandard ad formats that aren't available programmatically.

## But it's still early days for agentic media buying

**True end-to-end agentic media buying is in its infancy right now.** Cross-platform agentic media buying between buyer and seller agents that automates everything from negotiating terms to executing buys exists mostly in experimental proofs of concept.

**But some elements of agentic media buying already exist at scale.** Platforms have built buyer or seller agents specific to their sites, but they still lack full automation and have limited supply paths.

- **Walled garden APIs have aspects of seller agents.** All walled gardens offer buyers automated campaign tools, such as Google's Performance Max or Meta's Advantage+. These tools let brands buy ads based on budget and goals, but they're not built for attracting buyer agents in an open marketplace. They don't negotiate on price or share detailed audience or contextual information, and they don't follow a standardized protocol.

- **Walled gardens have also created agents that can build campaigns for buyers.** The closest to a true buyer agent in walled gardens is Amazon's Ads Agent, which lets brands build and execute campaigns. Google's Ads Advisor and Meta AI within Ads Manager can't execute campaigns. But they provide a chat interface where advertisers can discuss goals and get insights, suggestions, and ideas for creative, and implement them with advertiser approval. But all these tools only work within their platforms, and not as cross-platform negotiators and planners.
- **Vendor-specific buyer and seller agents also exist.** The Trade Desk's Kokai, Yahoo's DSP, and PubMatic's AgenticOS (among others) have buyer agents for their buy-side platforms, but their autonomy and scope are limited. On the sell side, companies like Magnite, FreeWheel, and PubMatic are building seller agents. These primarily ease buying and selling on their platforms and defined supply paths, although some are testing true cross-platform agentic media buying.
- **Platform-agnostic agents for creative, audience-building, and analytics are more advanced.** But orchestrating all those independent agents into a unified agentic media buying process is still in the early stages.

## Evolution vs. Revolution: Two competing visions vie for industry support

**At its core, agentic media buying needs a buyer agent, a seller agent, and a common set of protocols all connected via APIs.** In order for agentic ad buying to scale, other elements will likely be necessary as well. Among them are registries to identify and validate agents, signals provided by third-party APIs, and trusted environments that can facilitate meetings and transactions.

**Two competing initiatives are vying to define the common set of protocols, definitions, and data schemas to operate seamlessly:**

- **AAMP** came from the IAB Tech Lab, so proponents of AAMP span the demand and supply sides, including many of the ad tech companies that support the existing programmatic infrastructure.

- **AdCP** began as a mostly sell-side initiative, but it's gaining brand and agency support as well. A new nonprofit organization called the Agentic Advertising Organization (AAO) formed in late 2025 to manage the build-out of AdCP protocol.

## The evolutionary approach: AAMP aims to make existing programmatic pipes work faster and smarter

The IAB Tech Lab has a detailed road map to transform the existing programmatic ecosystem for display advertising into a system optimized for agents.

**The foundational layer is the Agentic Real-Time Framework (ARTF) protocol**, which was announced in November 2025. This protocol currently defines how buyer and seller agents can sit within trusted data environments—such as supply-side platforms (SSPs), demand-side platforms (DSPs), and data clouds—to exchange information seamlessly and nearly instantaneously. It makes existing programmatic functions work better. ARTF Version 2.0, which is still under development, will allow agents to communicate within platforms and also between them.

**ARTF is part of a broader strategy to “agentify” existing standards across both open auctions and programmatic direct sales.** Without going into too much detail on each, the agentic versions will make it easier for agents to create deal IDs, bid in open auctions, or sell curated inventory. They will also enable more dynamic relationships between buyers and sellers. For instance:

- **Agentic direct will enhance open direct.** Open direct gives preferred ad buyers first choice over premium inventory. It's the basis of programmatic guaranteed and is a static deal that ad buyers can take or leave. With agentic direct, agents can take over a lot of the manual work of programmatic guaranteed. The buyer and seller agents can negotiate deal terms and revise those terms as more data comes in.
- **Advertising Common Object Model (AdCOM) transforms into agentic ad objects.** AdCOM defines things like ad formats, placement, bid parameters, and creative requirements. Agentic ad objects add discretion and fluidity by responding to audience characteristics and context to alter bid requirements, creative, and frequency caps based on broad policies. Instead of only the features of an ad, agentic ad objects include what it

should do and gives the agent the discretion to change ad characteristics.

**IAB Tech Lab has also taken over a protocol for agentic audience matching developed by LiveRamp, called Agentic Audiences** (formerly User Context Protocol, or UCP). It enables privacy-enhanced and fine-tuned audience matching in milliseconds. It creates a vector chart that combines various facets of audiences and content, such as user interests and the content and tone of an article. It turns them into numerical representations, which agents can match without gaining access to the primary data.

**IAB Tech Lab is working on several other related initiatives, including:**

- **Agentic mobile:** a parallel standard for mobile programmatic
- **Agentic registry:** to verify and define agents

AAMP may have started with existing real-time and programmatic direct frameworks, but it's adding an impressive menu of tools for enabling a much quicker and more powerful way of transacting digital advertising.

## The revolutionary approach: AdCP aims to reimagine digital advertising from scratch

**The AdCP coalition, now organized under the AAO, represents a revolutionary change** that requires a new architecture that is native to agents and doesn't rely on existing IAB programmatic protocols.

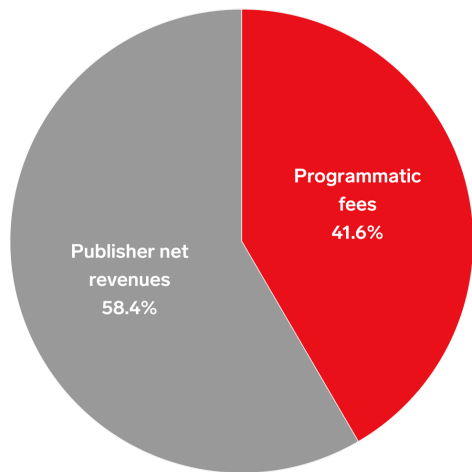

**AdCP is an open standard for ad buying and selling agents to converse directly with each other via APIs**, essentially enabling direct orders at scale. It's a conversational layer rather than an execution layer, although recent versions are simplifying connections with existing programmatic transaction layers as well.

**That's not to say buyer and seller agents are the only ones involved.** Signal providers remain important. Transaction and discovery environments will likely stay important. Those could include SSPs, DSPs, cloud environments, and exchanges that evolve to serve agentic interactions.

**But parts of the ad tech stack that can't prove value would be at risk.** Programmatic fees levied by intermediaries will take a 41.6% cut of total programmatic ad revenues in 2026, per our forecast. Not all of that is spent on services adding real value. For brands looking for unusual formats or lower transaction costs, the prospect of negotiating and transacting directly on publisher ad servers could be very attractive.

**Programmatic Fees Take More Than 40% of Gross RTB Ad Revenues Away From Publishers**  
*% of US real-time bidding (RTB) digital display ad spending, fees vs. net revenues, 2026*

*Note: RTB includes native ads and ads on social networks like Facebook and X (formerly Twitter); programmatic fees are the portion paid to tech and software intermediaries that execute the transaction before the publisher receives the spending as ad revenues*  
*Source: EMARKETER Forecast, Dec 2025*

362621 

[Click here to view our full forecast for US programmatic digital display ad spending fees.](#)

**AdCP and AAO are also working in conjunction with prebid.org on the Prebid Sales Agent**, which is standardized code for a sales agent representing publishers that's built for communicating using AdCP protocols. Large publishers can host this agent themselves, while smaller ones will likely use hosting platforms.

**New versions of AdCP will add even more functionality.** Version 3.0 (currently in development) will add better oversight for humans in the loop, more sophisticated standards for describing content, and better ways of querying sales agents about inventory and capabilities. It will also lay out an agent registry API for agent discovery hosted by AAO.

**Are the different visions competing or complementary?**

**They're both.** Many founding companies of AdCP are also working with the IAB Tech Lab. The existing programmatic ecosystem could still sit next to an emerging ecosystem for direct sales negotiated and executed on AdCP.

**Both protocols could thrive in the future.** AdCP could define the conversational layer between agents, while AAMP shapes the execution and integrations with existing parts of the ecosystem.

**But today, the two opposing camps view the other as ... misguided.**

**The Debate Between AAMP and AdCP Boils Down to Whether Ad Buying Needs an Evolution or a Revolution**

| Evolution: Agentic Advertising Management Protocols (AAMP)                                                                                                                                                                                                                                                                                     | Revolution: Ad Context Protocol (AdCP)                                                                                                                                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>"I think the [AdCP] approach is overly obtuse, and <b>there is no need to recreate the wheel</b>. There seems to be this mentality of 'let's bulldoze the entire house' when really what we're doing is a kitchen remodel. It's <b>an augmentation of programmatic, not a replacement</b>."</p> <p>Anthony Katsur<br/>CEO, IAB Tech Lab</p> | <p>"This whole generation, which probably unfortunately runs this industry right now, is having a terrible time getting out of this web-first, programmatic-first, display-first mindset, and <b>that's just not where the world's going</b>."</p> <p>Brian O'Kelley<br/>Co-Founder and CEO, Scope3</p> |

*Note: from EMARKETER interviews with Katsur on Feb 12, 2026, and with O'Kelley on March 2, 2026*

**Large walled gardens don't have an incentive to embrace either AdCP or much of AAMP.** They have reliable demand and proprietary standards already, and common standards could loosen their tight control over customer and performance data. Their customers would benefit from a common protocol. But that's probably not enough to convince walled gardens to adopt them, especially when they could make it easier for ad buyers to quickly shift away from their inventory when performance lags.

**Walled gardens are cementing their dominance in programmatic ad sales.** We estimate that walled gardens will capture nearly 80% of total US programmatic digital display ad spending this year. The current fragmented system works just fine for them.

## Walled Gardens Dominate Programmatic Spend, Limiting Incentives to Embrace Agentic Protocols

### walled garden vs. open web % of US programmatic digital display ad spending, 2023-2027

Note: a walled garden is a closed ad ecosystem where the publisher has access to first-party data and owns and controls all operations in the entire ad tech stack; its inventory is not available for purchase through third-party sellers or resellers; open web includes independent ad exchanges outside of walled gardens through third-party sellers and resellers  
Source: EMARKETER Forecast, Dec 2025

**Smaller walled gardens may benefit from adopting a common standard.** The larger a platform, the better the optimization works. Smaller walled gardens struggling to build scale may benefit from exposing some of their proprietary information to gain additional demand and scale, even if it means losing some control.

## What are the prospects for agentic ad buying at scale in 2026?

Proponents of agentic media buying have announced results from these early tests in tightly controlled environments, and they're unsurprisingly positive:

- **PubMatic** worked with agency **Butler/Till** and beverage producer **Geloso** to test agent-to-agent negotiating, planning, and executing of a media buy, which produced a fivefold increase in cost efficiency, per PubMatic. Altogether, PubMatic now has 1,000-plus agentic deals.
- **NBCUniversal (NBCU)** is working with **RPA**, **FreeWheel**, and **Newton Research** to create buyer and seller agents for both its linear and streaming inventory. Linear accounts for about 80% of premium TV inventory, per NBCU, and it is mostly sold manually. That presents a big opportunity for NBCU to automate it, including for highly sought after sports inventory that at times ends up unsold because of the comparatively slow pace of manual approvals.

These proofs of concept are expanding rapidly, but it's still very early days.

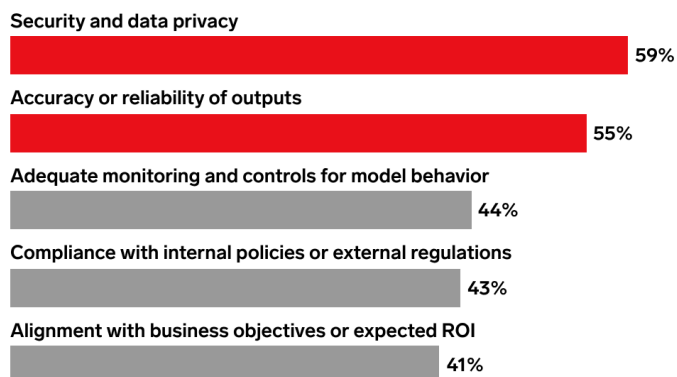

## A lot of basic infrastructure build-out needs to happen before widespread agentic buying and selling is possible

**The IAB Tech Lab and the AAO are working hard on building the infrastructure for agentic ad buying.** That's foundational. But even once that's in place, it will take a while for agentic ad buying to take off. It will require brands, agencies, and publishers to build their own agents, policies, and skills to scale their use. The infrastructure needs to be refined to protect privacy and reduce opportunities for rogue behaviors.

**Those elements—privacy and reliability—are the two leading factors that keep agents from moving from pilot to production**, according to a December 2025 Dynatrace survey of agentic AI leaders. Buying and selling agents face those issues as well. But as protocols and agency registries develop, those are solvable problems. It's more a question of when they'll be solved, not if.

## For AI Agents, Security and Accuracy Are the Top Criteria to Meet Before Moving to Production

% of agentic AI leaders worldwide, on criteria for moving agentic AI from pilot to production, Dec 2025

Note: n=919 senior leaders and decision-makers directly involved in or responsible for agentic AI development and implementation at large enterprises with annual revenues of \$100 million or more; top 5 responses shown

## Expect more testing in 2026, but mass adoption is probably a few years away

Optimists believe that late 2026 or early 2027 could be a turning point where agentic transactions grow beyond niche tests into a more broadly adopted way of buying digital advertising. More cautious insiders think that's about a year early for large-scale adoption.

And even enthusiasts think it will take several years before the majority of media buys will be transacted agent to agent. PubMatic, for instance, estimates that 25% of ad buys will be executed autonomously by agents by 2028 and will surpass 50% in 2030.

But most people believe that agentic ad buying will take off over the next several years. The advantages are just too big to ignore. But it will take a while to shift the industry and overcome reliability issues.

## What are the implications for brands and ad publishers?

### Brands

- **Experiment to your level of risk tolerance.** Neither AdCP nor AAMP can generate meaningful incremental revenues today. If you're willing to spend money now to test the standards, you can learn a lot and could even have a say in how they develop.
- **Work with partners involved in the technical build-out of these standards.** Buying agents are still in their infancy, so the people who understand them deeply are best positioned to use them effectively and identify where they're most useful.
- **Don't be dissuaded by the slow take-off of agentic commerce.** Consumers have been slow to embrace it. Agentic media buying is a different equation since brands and publishers will see real savings and new capabilities that will eventually lead to broad uptake.

### Ad publishers

- **Explore both protocol frameworks.** AdCP offers benefits to publishers that want to reduce the ad tech fees and connect directly with brands. But AAMP will make existing sales pathways more efficient. Both have advantages for publishers.
- **Build an interface that agents can read.** Agentic advertising runs on APIs, so creating an API that supports AAMP and AdCP is a comprehensive approach. But you could also rely on an SSP partner to provide the agentic infrastructure if you don't want to commit to building your own.
- **Reimagine what your ad monetization could do without format constraints.** Both protocols will enable new formats and packaging, although AdCP more so. Start thinking about what's possible.

# EMARKETER Interviews

EMARKETER research is based on the idea that multiple sources and a variety of perspectives lead to better analysis. Our interview outreach strategy for our reports is to target specific companies and roles within those companies in order to get a cross-section of businesses across sectors, size, and legacy. We also look to interview sources from diverse backgrounds in order to reflect a mix of experiences and perspectives that help strengthen our analysis. The people we interview for our reports are asked because their expertise helps to clarify, illustrate, or elaborate upon the data and assertions in a report.
